

Double-Blind Bicultural Content Match Pilot

This document outlines a proposal for a pilot project to design, validate, and deploy a **Double-Blind Bicultural Content Match Stories** placement engine. This pilot executes the progressive trust intermediation framework described in [\[\[wiki/pages/concepts/bicultural_integration_exchange|bicultural_integration_exchange\]\]](https://wiki/pages/concepts/bicultural_integration_exchange|bicultural_integration_exchange), bridging the gap between experiential/narrative candidate histories and standard corporate HR filtering systems.

1. Executive Summary

Traditional hiring systems in high-reliability and technical sectors depend heavily on standardized resume formats and automated Applicant Tracking Systems (ATS). However, conventional resume formats create an **Opacity** barrier for Indigenous candidates from reservation backgrounds. These candidates often communicate their capabilities, work histories, and responsibility structures through a narrative and experiential register that does not fit standard corporate HR profiles, resulting in high rejection rates.

Conversely, companies face high **Cognitive Bandwidth** constraints and **Risk** when evaluating candidates from non-traditional paths because they lack structured methods to translate narrative experience into technical capabilities.

This pilot project aims to build a double-blind, consent-gated match engine. The system translates an Indigenous candidate's experiential history (e.g., harvesting logistics, land stewardship) into equivalent industrial competencies paired with a 30-day onboarding blueprint. Simultaneously, it translates the employer's workplace culture and flexible capacity rules into a relational framework for the candidate. Identities are disclosed only after both sides opt-in to the generated match narrative.

1.1 The Target Problem Example: ATS Resume Filtering vs. Translated Match Narrative

To illustrate the difference, compare how a candidate's experiential background is typically filtered out by conventional HR screening versus how it is matched using a translated, double-blind bicultural register.

Profile A: Conventional Expository CV (Filtered Out by Standard ATS)

Candidate Profile ID: CAN-902 — Applicant History

- **Employment Gaps:** Unemployed November 2024 to April 2025; Unemployed November 2023 to April 2024.
- **Experience:**
 - *Seasonal Harvester & Family Caregiver* (November–April, multiple years): Gathered resources, managed family logistics, operated local snowmobiles and transport.
 - *Community Liaison, Band Council* (Part-time, 2023): Handled disputes, organized local meetings, distributed community notices.
 - *Construction Laborer* (Seasonal, 2021–2022): General site cleanup, hand tool operations.
- **Certifications:** Standard high school diploma, driver's license.

HR ATS Audit Verdict: *REJECT. High risk due to chronic seasonal gaps. Missing direct industrial logistics experience or enterprise resource planning (ERP) system credentials.*

Profile B: Translated Bicultural Match Story & Blueprint (Progressive Intermediation)

Match Narrative ID: Match-902-A (Double-Blind Profile)

Candidate Competency Translation:

- **Variable-Condition Resource Logistics:** Managed seasonal supply networks, cold-weather transport operations, and community equipment inventory under extreme environmental constraints. Equivalent to multi-domain logistics coordination and fleet management.
- **Multi-Stakeholder Relations:** Coordinated community communications, resource allocation, and dispute resolution across band council leadership, family units, and regional government representatives. Equivalent to cross-functional stakeholder management.
- **Asset Stewardship & Safety:** Maintained remote operational machinery under isolated conditions, executing safety checkups with zero equipment loss.

30-Day Onboarding Blueprint:

- *Week 1–2 (Technical Integration)*: Match candidate's spatial planning and equipment upkeep experience with the company's tool control protocols `[[wiki/pages/concepts/dual_register_playbook|dual_register_playbook]]`.
- *Week 3–4 (Relational Checkpoint)*: Introduce the local Shared Facilitator to coordinate communication between the team lead and the candidate, ensuring smooth transition dynamics.
- *Temporal Accommodation*: Candidate is backed by a peer-to-peer capacity rotation pool, allowing time away for seasonal community harvests without interrupting shop-floor output.

Company Relational Profile (Presented to Candidate):

"This workplace operates as a collective promise. Their team maintains a shadowboard tool inventory because they hold the safety of travelers in their hands. They respect seasonal harvests and family obligations, and they have committed a local Elder to guide your onboarding check-ins."

1.2 Setting the Project Foundation

This pilot addresses three core structural gaps in technical recruitment:

- **The Invalidation of Narrative Experience**: Conventional ATS systems actively filter out non-traditional work histories, missing high-reliability capabilities in logistics, leadership, and crisis management.
- **Progressive Disclosure of Identity**: By hiding specific identities, genders, and backgrounds until a mutual match is confirmed, the engine protects candidate privacy and prevents implicit corporate bias.
- **Integration from Day Zero**: Rather than placing a worker and hoping they adapt, the engine pairs the placement with a pre-configured, localized support structure (Facilitator + Onboarding Blueprint), addressing the operational root causes of retention failure.

1.3 Pilot Goals & Objectives

Using the bicultural matching framework, this pilot establishes four concrete goals:

- **Goal 1: Develop an AI Narrative-to-Competency Translation Model**: Map experiential, oral-tradition work histories to standard industrial skill taxonomies (such as AS9100

logistics, ISO quality roles) without losing the candidate's authentic voice.

- **Goal 2: Achieve Mutual Double-Blind Match Approvals:** Validate that double-blind bicultural match stories lead to higher initial interview acceptance rates from hiring managers compared to standard CVs.
- **Goal 3: Increase 90-Day Retention Rates:** Target a measurable increase in 90-day employee retention by pre-integrating the match with dynamic scheduling and Shared Facilitators [\[\[wiki/pages/concepts/shadow_capacity|shadow_capacity\]\]](#).
- **Goal 4: Enforce OCAP Data Sovereignty:** Ensure all candidate narrative profiles are stored on sovereign, community-controlled databases [\[\[wiki/pages/concepts/platform_governance_models|platform_governance_models\]\]](#).

1.4 Diagnostic Foundation: DeeperPoint Market Physics

This pilot applies the DeeperPoint **thin market diagnostic methodology** to systematically identify which structural friction forces block Indigenous workforce integration through standard hiring channels. Using the 11-challenge taxonomy from DeeperPoint's Intervention Matrix, the pilot targets three specific resistance forces:

- **Opacity:** Narrative and experiential work histories are structurally invisible to conventional ATS and HR screening systems, filtering out high-capability candidates.
- **Cognitive Bandwidth:** Hiring managers lack the structured frameworks to evaluate non-traditional experience, creating decision paralysis and defaulting to familiar credential patterns.
- **Temporal Distance:** Post-placement retention failures stem from rigid scheduling that cannot accommodate seasonal and ceremonial obligations, creating a friction force that standard onboarding ignores.

The DeeperPoint research program has produced open-source tools — including the **Cosolvent** matching engine and **ClientSynth** simulation harness — that can accelerate implementation in later phases. Cosolvent's double-blind, consent-gated matching protocol is architecturally aligned with this pilot's progressive trust model. ClientSynth enables risk-free simulation of matching accuracy before live deployment. However, the pilot's methodology and diagnostic approach stand independently of any specific software platform; these tools reduce cost and timeline but are not prerequisites.

2. Industry Targets & Core Matching Scenarios

The pilot focuses on two primary sectors — **aerospace** and **mining** — where Indigenous workforce proximity, role volume, and the specificity of competency translation create the

strongest conditions for validation. Automotive is retained as a secondary expansion target.

Industry Sector	Target Roles	Candidate Translation Area	Partner Readiness Requirement
Aerospace (Primary)	Inventory Specialists, Material Control, Assembly Tech	Mapping hunting precision, traditional carving, and tool care to AS9100 quality/tool audits.	Commitment to host a local Shared Facilitator.
Mining (Primary)	Conveyor Safety Monitors, Equipment Operators	Mapping land navigation, survival logistics, and environmental tracking to site safety.	Openness to coordinate with Band Councils on safety oversight.
Automotive (Secondary)	Assembly Logistics, Fleet Sourcing, Team Leads	Mapping community coordination and seasonal harvest logistics to parts supply chains.	Agreement to participate in peer-to-peer shift rotation scheduling.

3. Human & Strategic Resources

The pilot operates under a low-overhead model relying on three key participant groups:

3.1 Architect & Methodology Lead (Mustafa Uzumeri)

- **Role & Core Background:** Designs the matching ontology, structures the translation rules, and oversees technical alignment. Mustafa Uzumeri's experience in building structured corporate training and process validation programs ensures the translated competencies directly satisfy formal quality standards.
- **Bandwidth Constraint:** Architectural guidance and validation oversight only; no direct day-to-day placement operations
[[wiki/pages/concepts/available_resources|available_resources]].

3.2 Academic Recruitment Analysts (Trent University & Mount Royal University)

- **Role:** Students from Trent University, ON and Mount Royal University, AB will act as interns to:
 - Work with candidates to collect narrative histories and experiential descriptions.
 - Iterate on the AI-generated bicultural translations to ensure linguistic accuracy and respect.

- Draft company relational profiles based on workplace safety and scheduling policies.
- **Institutional Relationships:** Dr. Don McCaskill (Trent University) and Dr. Linda Manyguns (Mount Royal University) have expressed strong interest in exploring possible projects through their respective institutions. Both bring decades of experience in Indigenous education and bicultural programming, and their 40-year professional collaboration provides a uniquely strong academic foundation for this work.
- **Funding:** Funded through co-op and research envelopes (SSHRC, Mitacs).

3.3 Strategic Access Facilitators

- **Founding Coalition:** The pilot benefits from an established network of collaborators with deep roots in both Indigenous communities and institutional networks:
 - **Michael Thrasher** (4 Skies Energy Solutions, Six Nations of the Grand River): Community and industry bridge, providing direct access to First Nations governance structures and industrial partnerships.
 - **Dr. Linda Manyguns** (Mount Royal University): Academic and institutional facilitator with extensive networks in Treaty 7 communities and Alberta's educational institutions.
 - **Dr. Don McCaskill** (Trent University): Academic and policy facilitator with deep relationships across Ontario First Nations communities and federal Indigenous policy networks.
- **Role:** These facilitators, drawing on 40 years of collaboration, along with Indigenous employment officers, Band Council representatives, and regional training consultants, will:
 - Identify candidate pools and manage local community registry consent.
 - Serve as the Shared Facilitator pool matching with the placements.
 - Audit the platform's data management to ensure OCAP compliance.

3.4 AI-Driven Matching Pipeline

The system operates as a progressive disclosure matching pipeline powered by AI under strict human-in-the-loop governance:

- **AI Translation Engine:** Parses narrative inputs (such as recordings of candidate work stories) and maps them to technical competency tags (logistics, safety, team leadership) while drafting the anonymous match profile.
- **Cosolvent Matcher:** Analyzes the overlap between translated capabilities, onboarding readiness, and geographic/temporal parameters to generate the Double-Blind Match Story.
- **Verification & Opt-In:** A Trent student analyst and local facilitator review the match story for authenticity. The anonymous story is then presented to both parties. Identity and contact details are only disclosed upon mutual opt-in.

4. Phased Revision & Implementation Roadmap

The matching engine pilot is divided into four distinct development phases, allowing for revision cycles at each gate:

Phase 1: Team Formation & Core Matching Ontology Design (Version 1.x)

- **Activities:**
 - Form the pilot coalition (Mustafa Uzumeri, Trent University coordinates, and regional employment boards).
 - Define the taxonomy mapping narrative experiences to technical competencies.
 - **AI-Assisted Operations:** Leverage generative AI tools to research and map traditional narrative registers to standard industrial skill domains, helping build the foundation of the bicultural translation ontology. Use AI tools to draft initial proposals, matching templates, and coordinate coalition planning documents.
- **Revision Trigger:** Review and approval of the mapping taxonomy by Trent Indigenous Studies coordinators and participating HR managers.

Phase 2: Double-Blind Match Storyboard & Blueprint Design (Version 2.x)

- **Activities:**
 - Build standard templates for anonymous match profiles and company relational profiles.
 - Draft candidate translations for the first cohort.
- **Revision Trigger:** Review by local Elders and facilitators to ensure OCAP data compliance and cultural safety of narrative translations.

Phase 3: ClientSynth Simulation & Validation (Version 3.x)

- **Activities:**
 - Deploy simulated candidate profiles and corporate openings in a ClientSynth testbed.
 - Verify match accuracy, scoring bias, and compliance alignment.
- **Revision Trigger:** Successful verification of match stability and compliance with AS9100/ISO standards by policy and quality audit advisors.

Phase 4: Pilot Site Placement & Match Launch (Version 4.x)

- **Activities:**
 - Deploy the match engine with active candidates and target manufacturing partners.
 - Activate Shared Facilitator check-ins and monitor 90-day retention rates.
- **Revision Trigger:** Post-pilot debrief to optimize onboarding blueprints for next-stage commercial scaling.

4.5 AI Technology, Cost, and Risk Profile by Phase

The pilot uses an incremental AI technology roadmap to minimize initial cost and mitigate data-sovereignty risks.

Phase	AI Support Level	AI Technology Focus	Work & Development Effort	Expense Profile	Technical & Operational Risk
Phase 1: Ontology	Medium	AI-assisted research, idea assembly, and matching ontology plan drafting.	Low (Prompt engineering, research synthesis)	Very Low (Standard LLM/API subscription costs)	Very Low (Design-stage support only; no operational risk)
Phase 2: Storyboard	Medium	Generative LLM drafting; processing and parsing Elder/facilitator review transcripts.	Moderate (Template prompt design, translation parsers)	Low to Moderate (API usage tokens, pipeline scripting)	Low to Medium (Mitigated by mandatory human-in-the-loop Elder review)
Phase 3: Simulation	High	Multi-agent user simulations (e.g., ClientSynth) and automated match scoring.	High (Simulation testbed construction, multi-agent matching scripting)	Moderate to High (Development costs, high token usage)	High (Simulation accuracy vs. real-world behavior, match stability)
Phase 4: Pilot Launch	High	Production API pipeline integration, secure identity masking, and OCAP candidate registry.	High (Production software deployment, secure data room setup)	High (Sovereign database deployment, security audits)	High (Operational compliance, data sovereignty, recruitment integration)

5. Academic Rigor & Long-Term Scaling Vision

To ensure the matching system provides permanent career paths and community-controlled economic development, the project has a clear scaling trajectory.

5.1 Academic Study & Research Process

The pilot operates in tandem with a research study at Trent University or Mount Royal University:

- **Evaluation Metrics:** Compare bicultural matched candidates against standard placement control groups on onboarding time, 90-day attrition, and worker well-being.
- **Linguistic Mapping Research:** Document the effectiveness of translating narrative experiences to corporate competencies, contributing to the academic literature on bicultural HR practices.

5.2 Commercialization & Indigenous Entrepreneurship (Bicultural Placement Platform)

Following a successful pilot, the matching platform will transition to an Indigenous-led recruitment agency:

- **Incubation:** Mentor Indigenous graduates to own and run the platform.
 - **High-Margin Model:** Leveraging AI for competency mapping and match story drafting keeps operational overhead low, allowing the agency to charge standard commercial recruitment fees (15–20% of first-year salary) to industrial firms seeking to fulfill ESG and federal 5% procurement requirements.
 - **Community Sovereignty:** The core database is maintained as an Ostrom-based platform commons, ensuring the community retains control of their career profiles and data assets.
-
